```
1-aminocyclopropane-1-carboxylic acid (ACC) synthase is essential for the production of ethylene in higher plants; ethylene is a determinant of fruit ripening. The present invention relates to an expression cassette which comprises the reverse transcript of RNA complementary to an RNA transcribed from ACC synthase gene. The expression cassette can be used to prevent ACC gene expression. The expression cassette is useful for inhibiting ethylene production and fruit ripening, when introduced into a plant or plant cells. The present sequence is the coding sequence for

The method involves the expression of a 1-aminocyclopropane-1-carboxylic acid (ACC) deaminase gene in a plant at a level sufficient to reduce ethylene production in the fruit.

This cDNA clone, designated pPHSacc44 (ATCC 98178), codes for a 54.2 kDa 1-aminocyclopropane-1-carboxylate synthase (ACC synthase) (see AAW6024) of geranium (Pelargonium x hortcrum cv. Sincerity). High quality mRNA was obtained from flower tissue using a novel adaptation of the 2-butoxyethanol precipitation technique. This was converted to cDNA and screened with a probe generated by PCR amplification (see AAV30328-29). The PPHSacc44 (see AAV30328-29). The PPHSacc44 (see AAV30326), and rose ACC synthase cDNA clone pRsacc40 (see AAV3030), are also claimed. These ACC synthase genes, or their (see AAV3030), and missense orientation under control of a strong promoter, can be used to genetically modify a plant, especially geranium, rose or woody plant. As a consequence, the amount of ACC synthase produced in the plant cells is reduced and the rate of ACC conversion to ethylene decreases. This can be used to prolong the shelf-life of cut flowers and to reduce leaf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                243
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241

2 DNA sequences (AAT66246-47) respectively code for 1-aminocyclopropane carboxylase synthases (ACC synthase) GAC-1 (AAW09878) and GAC-2 (AAW09879), enzymes involved in the biosynthesis of ethylene in plants. In a method for the commercial production of transgenic plants, Agrobacterium vectors carrying antisense of ECC synthase or ACC cxidase (see also AAT66248) are used to inoculate petiole explants of a mother plant, pref. Pelargonium x domesticum. The resulting callus is cultured and used to regenerate transgenic plants. The antisense genes prevent formation and fruit ribening.

/clone_lib="Gm-ri083"
/note="The library Gm-ri083 is a sequence-driven, reracked set of 4,992 clones selected from Chall Librarias from various tissues and stages of development of soybean. It represents 1117 sequences from the progenitor library Gm-cl099 (from mature roots of 2 month old greenhouse grown 'Williams' soybean plants); 820 sequences from the progenitor library Gm-cl013 (from 2 to 3 week old whole plants of Williams); and 3055 sequences from the plants of Williams); and 3055 sequences from the plants of Williams); and 3055 sequences from the clark Stacey). The 5' ESTS of the source clones from the different progenitor libraries was used to select singletons, or a representative of each contig, which were reracked to form library Gm-ri083. The cONA clones of the reracked Cm-ri083 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by the laboratory of Ennest Retzel, Center for Computational Genomics and Bloinformatics, University of Minnesota, http://www.lncyte.com, and 3' sequencing by the Reck Center for Comparative and Bloinformatics, St. Louis, http://www.incyte.com, and 3' sequencing by the Reck Center for Comparative and Functional Genomics, University of Illinols, http://www.lncyte.com, and 3' sequencing by the Reck Center for Comparative and Functional Genomics, Of Illinols, http://www.lncyte.com, and 3' sequencing by the Reck Center for Comparative and Functional Genomics, Conter for Comparative and Functional Genomics and Co

The seedlings were innoculated with Bradyrhizoblum japonicus, strain USDAINO priot to harvest. Stratagene's CDNA synthesis Kit (catalog number 200401) was used to synthesize the CDNA. First-strand synthesis was performed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tel: 314 286 1800

hemimethylated. A modification of Stratagene's hemimethylated. A modification of Stratagene's first-strand synthesis primer was used. An 'anchor' nucleotide (VaA,C, or G) was added to the 3' end of the primer [GAGAGAGAGAGACACTAGTCTCCAG(T)18V] to anchor the primer at the 5' end of the poly(A) tract. After second-strand synthesis, the cDNA ends were filled in with cloned Pfu DNA polymerase, ligated to EcoRI adapters and subsequently phosphorylated. The XhoI site within the first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500bp cutoff, using GibcoBRL Life Technologies' cDNA Size Fractionation column. The column eluent was then ligated into Stratagene's spluescript II SR(+) that has been digested with EcoRI and XhoI, and phosporylated by Stratagene). Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=25). This library was constructed by Dr. Paul Reim and Dr. Virginia Coryell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 715

/note="Vector: pBluescript II XR; Site_l: EcoRI; Site_2:
XhoI; This cDNA library was constructed from mRNA isolated
from immature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a XhoI restriction site. EcoRI adapters
were ligated to the blunt-ended cDNA fragments followed by
XhoI digestion. The cDNA fragments were directionally
cloned into the EcoRI-XhoI restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into Xilo-Gold host cells. This library was
constructed by Dr. Randy Shoemaker and Dr. John

XhoI: The CDNA library was constructed from mRNA isolated
from drought stressed leaf tissue of the cultivar Williams
82. The month old greenhouse grown plants were deprived of
water for 3 days prior to harvesting the stressed leaf
tissue. Complementary DNA was synthesized from mRNA using
a primer consisting of a poly(dT) sequence with a XhoI
restriction site. ECORI adapters were ligated to the
blunt-ended CDNA fragments followed by XhoI digestion. The
CDNA fragments were directionally cloned into the
ECORI-XhoI restriction site of the pBluescript vector. The
ligated CDNA fragments were transformed into DH10B host

/lab.host="E. coli strain XLOLR"
/note="Vector: pBluescript SK-; Site_1: EcoRI: Site_2: XhOI; cDNA was prepared from polya+ enriched RNA from roots harvested at 10 days post inoculation with Phytophthora medicaginis. The cDNA was directionally ligated into the Uni-ZAP XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-ZAP phage using Ex-Assist helper phage and propagated in XLOLR cells. Note: EST may be of fungal origin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä

/note="Vector: pBluescript II SK+; Site_I: EcoRI; Site_2:
XhoI; The CDNA library was constructed from mRNA isolated
from unexpanded leaves and the shoot tips of 2 week old
seedling from the cultivar Williams. The 2 week old
seedlings were salt stressed in a solution of 500mM NaCl
for 3 days prior to harvesting. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the EcoRI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments were
transformed into DHIOB host cells (GibcoBRL). This library
was constructed in the laboratory of Dr. Randy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Email: estéwatson wustl.edu

//did_nost=_Uniost=_DiluserriptII SK+; Site_1: EcoRI; Site_2:
XhoI; This cDNA library was constructed from mRNA isolated
from etlolated hypocotyl tissue of 9-10 day old seedlings
of the cultivar Williams 82. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) primer with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
fragments were ligated to the blunt-ended cDNA fragments
fragments were directionally cloned into the EcoRI. XhoI
restriction site of the pBluescript vector. The ligated
cDNA fragments were transformed into DH10B host cells
(Gibco BRU, This library was constructed by Dr. Randy
Shoemaker."
